Vamos configura o o arquivo docker.yml

colocando o endereço do docker.sock baixo, no campo host e alterando o que desejamos monitorar.

Só deu certo quando o docker.yml ficou assim:

"

```

To connect to Docker over TLS you must specify a client and CA certificate.

```

#ssl:
  #certificate_authority: "/etc/pki/root/ca.pem"
  #certificate:          "/etc/pki/client/cert.pem"
  #key:                  "/etc/pki/client/cert.key"

Vamos configurar o heartbeats.yml para monitorar o próprio elastic

A unica que alteramos ficou assim:

```
# List or urls to query
urls: ["http://elastic.co/pt/"]
```

Testando antes de inicializar:

```
marco@DESKTOP-G2455QH:~/treinamentos/elastic/heartbeat-7.9.2-linux-x86_64$ ./heartbeat test config
Config OK
marco@DESKTOP-G2455QH:~/treinamentos/elastic/heartbeat-7.9.2-linux-x86_64$ ./heartbeat test output
elasticsearch: http://localhost:9200...
  parse url... OK
  connection...
    parse host... OK
    dns lookup... OK
    addresses: 127.0.0.1
    dial up... OK
  TLS... WARN secure connection disabled
  talk to server... OK
  version: 7.9.2
marco@DESKTOP-G2455QH:~/treinamentos/elastic/heartbeat-7.9.2-linux-x86_64$
```

Como boas práticas mudar o dono do arquivo para root.

```
marco@DESKTOP-G2455QH:~/treinamentos/elastic/heartbeat-7.9.2-linux-x86_64$ sudo chown root heartbeat.yml
[sudo] password for marco:xxxxx
```

Inicializar o heartbeat

```
marco@DESKTOP-G2455QH:~/treinamentos/elastic/heartbeat-7.9.2-linux-x86_64$ sudo ./heartbeat -e
```
